## Identification of socio-ecological factors and obstacles for agroforestry adoption-Côte d'Ivoire.

## Geographic stakes of farmers innovations in cocoa agroforestry - Côte D'ivoire- Identification of factors and obstacles for agroforestry adoption

## ABSTRACT

The main objective of the project is to understand whether new forms of agroforestry (maybe lighter densities and diversities of associated trees with a better management of the shade and canopy) could be a solution for the agro-ecological transition of cocoa cropping in Côte d'Ivoire. Underneath this main objective lie several side objectives :

• listing trees and cocoa tree interactions and compatibility from farmers knowledge

• gathering agroforestry innovations thanks to botanical inventories to understand whether cocoa farmers are adding trees in their cocoa farms

• understanding the factors and obstacles for agroforestry adoption including social, economic, politic and legal extent to describe the drivers of this new socio-ecological system.

• experimenting the effects of three trees (identified by farmers as compatible with cocoa) on microclimate and more specifically their role during dry period.

We expect from this mobility to :

 ${\mbox{\circ}}$  be able to give advice to farmer on three trees : Newbouldia laevis, Ficus capensis, Bombax buonopozense .

• Completing lists that have already been set about trees and cocoa interactions based on farmers knowledge (up to 25 trees)

• Building a qualitiative model of agroforestry adoption and innovation in order to facilitate any further project trying to encourage the development of agroforestry.

• Developing interdisciplinary methodologic tools to study an agroforestry socio-ecological system in a context of agro-ecological transition.

• Strenghten links with ivorian researchers working in similar fields.
