

REFLORAMAZ

Forest restoration by smallholders in the Eastern Amazon: how to improve the balance between environmental and socioeconomic benefits?

ABSTRACT

Brazil committed internationally to recover 12 million ha of forests by 2030 but the strategy is still unclear. Many small-scale farmers have been spontaneously developing forest restoration experiences, mainly through agroforestry systems. To guide more inclusive restoration policies, it is important to assess the socio-economic viability and ecological benefits of the different systems.

Keywords : 1. Exclu de la photothèque

Year : 2015

Project number : 1503-011

Type of funding : AAP

Project type : AAP EMBRAPA

Research units in the network : AMAP F&S

Start date : 2017-01-01

End date : 2018-12-31

Flagship project : no

Project leader : Emilie Coudel

Project leader's institution : CIRAD

Project leader's RU : GREEN

Budget allocated : 50000 €

Total budget allocated (including co-financing) : 100000 €

Funding : Labex

GOAL

This project will establish a learning-practice network of leading reforestation practitioners and researchers on the theme of forest restoration by smallholders in the Eastern Amazon, to support policy delivery and restoration actions at large scale.

The main scientific objectives are to:

- i) identify, through a collaborative multi-stakeholder process, what are the key factors that motivate or limit smallholders to engage in forest restoration,
- ii) to assess the enabling conditions necessary to balance the provision of both environmental services and social and economic benefits to support the practical implementation of policies

RESULTS

This project aims to bring three original contributions on forest restoration:

1/ It will provide a broad interdisciplinary perspective on a topic that has traditionally been dealt with by separate research communities, mobilizing ecologists, agronomists and social scientists to study together the ecological and social trade-offs of agroforests.

2/ It will address the specificities of family farmers regarding forest restoration, to assess the potential contributions to and relevance for family farmers of restoration, but also understand their own opinions on restoration and compliance with the Forest Code by understanding their motivations and the place of

restoration in their production system.

3/ By adopting a multi-stakeholder perspective, the project will facilitate knowledge exchange between research and technical and development institutions, in order to discuss the policy implications of restoration.

PERSPECTIVES

A role playing game, co-constructed with the various stakeholders, will enable to explore different restoration models and landscape patterns, as well as to discuss which actions and policies would be most supportive.
